**Obesity Prevention** Laurette Dube, 2010-06-25 Over the years approaches to obesity prevention and treatment have gone from focusing on genetic and other biological factors to exploring a diversity of diets and individual behavior modification interventions anchored primarily in the power of the mind to the recent shift focusing on societal interventions to design temptation proof physical social and economic environments In spite of repeated calls to action including those of the World Health Organization WHO the pandemic continues to progress WHO recently projected that if the current lifestyle trend in young and adult populations around the world persist by 2012 in countries like the USA health care costs may amount to as much as 17.7% of the GDP Most importantly in large part due to the problems of obesity those children may be the first generation ever to have a shorter life expectancy than that of their parents Obesity Prevention presents the most current research and proposals for addressing the pandemic Past studies have focused primarily on either genetic or behavioral causes for obesity however today's research indicates that a strongly integrated program is the best prospect for success in overcoming obesity Furthermore focus on the role of society in establishing an affordable accessible and sustainable program for implementing these lifestyle changes is vital particularly for those in economically challenged situations who are ultimately at the highest risk for obesity Using studies from both neuroscience and behavioral science to present a comprehensive overview of the challenges and possible solutions The brain to society approach to obesity prevention focuses on what is needed in order to sustain a healthy pleasurable and affordable lifestyle Explores the brain to society approach to obesity prevention focusing on an integrative approach to addressing the obesity pandemic Presents both the neuroscientific and the behavioral factors that impact eating habits Identifies the challenges and suggests solutions for altering attitudes toward food on both an individual and a societal level

Multisensory Development Andrew J. Bremner, David J. Lewkowicz, Charles Spence, 2012-06-21 We perceive and understand our environment using many sensory systems vision touch hearing taste smell and proprioception These multiple sensory modalities not only give us complementary sources of information about the environment but also an understanding that is richer and more complex than one modality alone could achieve As adults we integrate the multiple signals from these sense organs into unified functional representations However the ease with which we accomplish this feat belies its computational complexity Not only do the senses convey information about the environment in different neural codes but the relationship between the senses frequently changes when for example the body changes posture e g when the eyes move in their sockets or indeed shape when the body grows across development These computational problems prompt an important question which represents the key focus of this book How do we develop the ability to integrate the senses While there is a considerable literature on the development of single senses such as vision or hearing few books have considered the development of all our senses and more importantly how they develop the ability to work with each other This book is unique in exploring this extraordinary feat of human nature how we develop the ability to integrate our senses It will be an important book for all those in the fields of cognitive and developmental neuroscience

of diversity in the classroom and the workforce It is now common to see in elementary school high school and university classrooms not to mention boardrooms and factory floors a mixture of ethnicities races genders and religious affiliations But these changes in academic and economic opportunities have not directly translated into an elimination of group disparities in

academic performance career opportunities and levels of advancement Standard explanations for these disparities which are vehemently debated in the scientific community and popular press range from the view that women and minorities are genetically endowed with inferior abilities to the view that members of these demographic groups are products of environments that frustrate the development of the skills needed for success Although these explanations differ along a continuum of nature vs nurture they share in common a presumption that a large chunk of our population lacks the potential to achieve academic and career success In contrast to intractable factors like biology or upbringing the research summarized in this book suggests that factors in one's immediate situation play a critical yet underappreciated role in temporarily suppressing the intellectual performance of women and minorities creating an illusion of group differences in ability Research conducted over the course of the last fifteen years suggests the mere existence of cultural stereotypes that assert the intellectual inferiority of these groups creates a threatening intellectual environment for stigmatized individuals a climate where anything they say or do is interpreted through the lens of low expectations This stereotype threat can ultimately interfere with intellectual functioning and academic engagement setting the stage for later differences in educational attainment career choice and job advancement

**The Dorito Effect** Mark Schatzker, 2015-05-05 A lively and important argument from an award winning journalist proving that the key to reversing North America's health crisis lies in the overlooked link between nutrition and flavor In *The Dorito Effect* Mark Schatzker shows us how our approach to the nation's number one public health crisis has gotten it wrong The epidemics of obesity heart disease and diabetes are not tied to the overabundance of fat or carbs or any other specific nutrient Instead we have been led astray by the growing divide between flavor the tastes we crave and the underlying nutrition Since the late 1940s we have been slowly leeching flavor out of the food we grow Those perfectly round red tomatoes that grace our supermarket aisles today are mostly water and the big breasted chickens on our dinner plates grow three times faster than they used to leaving them dry and tasteless Simultaneously we have taken great leaps forward in technology allowing us to produce in the lab the very flavors that are being lost on the farm Thanks to this largely invisible epidemic seemingly healthy food is becoming more like junk food highly craveable but nutritionally empty We have unknowingly interfered with an ancient chemical language flavor that evolved to guide our nutrition not destroy it With in depth historical and scientific research *The Dorito Effect* casts the food crisis in a fascinating new light weaving an enthralling tale of how we got to this point and where we are headed We've been telling ourselves that our addiction to flavor is the problem but it is actually the solution We are on the cusp of a new revolution in agriculture that will allow us to eat healthier and live longer by enjoying flavor the way nature intended
